DAN ELBAZ

Software Engineer | Backend Development | AI Integration

Petah Tikva, Israel | +972-52-632-2805 | danelbaz3@gmail.com | linkedin.com/in/danelbaz30 | github.com/danelbaz2

SUMMARY

4 years at Elbit Systems in infrastructure automation and production support; since mid-2026, full-time backend and AI development. Designed HD Manager, a production CRM (Python/Flask, React, MongoDB), and co-designed the RAG pipeline of the AI platform built on it. B.Sc. in Computer Science, HIT (**GPA 95, Dean's List**), earned while working full-time.

Seeking a backend, software engineering or full-stack role, with a strong interest in AI and LLM systems.

TECHNICAL SKILLS

Languages: Python, Java, SQL, TypeScript / JavaScript, Bash, PowerShell, C/C++

Backend: Flask, Node.js, REST APIs, Microservices, WebSockets, Multithreading, OOP

AI & LLM: RAG (embeddings, contextual retrieval, reranking), OpenAI & OpenRouter APIs, AI coding agents (Claude Code, Copilot)

Databases: PostgreSQL, MongoDB (aggregations, schema design, vector search)

Infrastructure: Docker, OpenShift, Linux (RHEL), Git, Ansible, Windows Server

Testing: pytest, JUnit

Frontend: React, Next.js

EXPERIENCE

Elbit Systems | *Netanya, Israel* | *2022 – Present*

Application Support Engineer (Tier 3) *2025 – Present*

Since mid-2026: *full-time backend & AI development on an internal AI platform (company hackathon)*

- Developer on a 5-person team (one of two writing the code) building an **AI incident-management platform** on HD Manager: external incident-system integrations, CRM data, LLM chatbot, workflow generation. Demoed to the CBO and AI integration leads.
- Co-designed and implemented the **document ingestion and retrieval (RAG) pipeline**: chunking, embeddings, contextual retrieval, top-k search, reranking and LLM answers built from the retrieved sources.
- Resolved **production incidents** across Dockerized Java and Python microservices on OpenShift by tracing code, service logs, Git branches and MongoDB/SQL data, often with no documentation.
- Wrote Bash and Python automation for log extraction, data retrieval and system diagnostics.

Automation & Infrastructure Developer *2022 – 2025*

- Built server provisioning and orchestration automation (PowerShell, Ansible) that cut infrastructure deployment **from 4 days to ~6 hours** with far fewer human errors; run in dozens of deployments, including critical periods.
- Developed lifecycle scripts for controlled startup, shutdown and failover of critical systems.

PROJECTS

HD Manager · *Work initiative, in production at Elbit* — *Flask, React, MongoDB, WebSockets, Docker*

- Proposed the idea and designed the architecture of a real-time CRM for the support team, then built it with a colleague.
- Live state sync over WebSockets, schema-validated REST API, and a MongoDB data model with version-controlled state.

Concurrent Retail System · *Academic team project* — *Java, Sockets, Multithreading, JUnit* GitHub

- Multi-threaded client-server system for a store chain: one handler thread per client over TCP sockets, with shared inventory kept consistent through synchronization.

Job Hunter · *Personal project* — *Next.js, TypeScript, PostgreSQL* Live demo | GitHub

- Built during my own job search: aggregates four Israeli job boards behind one adapter layer and scores fit with an LLM, keeping only claims quoted verbatim from the listing.

EDUCATION

B.Sc. in Computer Science — Holon Institute of Technology (HIT) *2026*

Final GPA 95/100 · Dean's List (first year, GPA 98) · Completed while working full-time

IDF Excellence Award · Linux Administration & System Fundamentals, IDF C4I Division *(2022)*
